

Adjustable back

For improved postural control and reduced risk of deformity while increasing potential for activity, the adjustable back allows you to correct and maintain an optimal position based on individual needs and status.

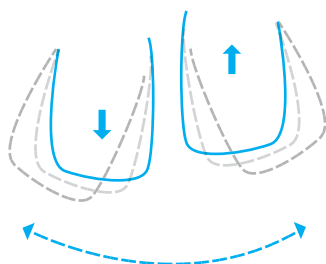

Adjustable hip/back angle & tilt

A stable base of support is needed to assist the user in creating a functional seated position. A dynamic system is also necessary in order to allow for freedom of movement, variation, and as a means of reducing the effects of extension spasticity.

Pressure reducing lining

The material used for Zitzi Clozitts lining reduces pressure thereby improving pressure distribution over an increased area. It is also specially developed for hygienic purposes as it repels both moisture- and soil.

Adjustable leg parts

The thighs supports can be adjusted exactly to suit seat depth and abduction, thus creating an optimal seated position which can “grow” with the user. It is even possible to create an open hip angle if needed.
